## Description

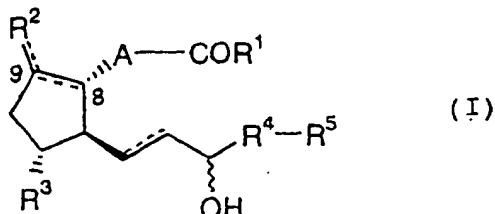

## Technical Field

5 [0001] The present invention relates to  $\omega$ -substituted phenyl-prostaglandin E derivatives. More particularly, the present invention relates to

(1)  $\omega$ -substituted phenyl-prostaglandin E derivatives of formula (I)

10

15

20

(wherein all symbols have the same meaning as described hereafter.),  
 (2) a process for the preparation thereof and  
 (3) a medicament comprising them as active ingredient.

## Background

25

[0002] Prostaglandin E<sub>2</sub> (abbreviated as PGE<sub>2</sub> hereafter.) has been known as a metabolite in the arachidonic acid cascade. It has been known that PGE<sub>2</sub> has cyto-protective activity, uterine contractile activity, a pain-inducing effect, a promoting effect on digestive peristalsis, an awakening effect, a suppressive effect on gastric acid secretion, hypotensive activity and diuretic activity, etc.

30

[0003] In the recent studies, it was found that PGE<sub>2</sub> receptor was divided into some subtypes which possess different physiological roles from each other. At present, four main receptor subtypes are known and they are called EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub> and EP<sub>4</sub> (Negishi M. et al., J. Lipid Mediators Cell Signaling, 12, 379-391 (1995)).

35

[0004] The present inventors investigated to find new compounds which bind on each receptor specifically, so that we found that the compounds of the present invention could bind selectively on EP<sub>4</sub> subtype receptor and achieved the present invention.

40

[0005] The compounds of the present invention of formula (I) bind strongly on subtype EP<sub>4</sub> and therefore are useful for the prophylaxis and/or treatment of immune diseases (autoimmune diseases (amyotrophic lateral sclerosis (ALS), multiple sclerosis, Sjogren's syndrome, arthritis, rheumatoid arthritis, systemic lupus erythematosus, etc.), post-transplantation graft rejection, etc.), asthma, abnormal bone formation, neurocyte death, pulmopathy, hepatopathy, acute hepatitis, nephritis, renal insufficiency, hypertension, myocardial ischemia, systemic inflammatory syndrome, pain induced by ambustion, sepsis, hemophagocytosis syndrome, macrophage activation syndrome, Still's diseases, Kawasaki diseases, burn, systemic granuloma, ulcerative colitis, Crohn's diseases, hypercytokinemia at dialysis, multiple organ failure, shock, etc. They are also related with sleeping disorders and platelet coagulations, and therefore they are thought to be applicable to these diseases.

45

[0006] The compounds of the present invention of formula (I) bind weakly on other PG receptors including other subtypes and do not express other effects, and therefore it is probable that those compounds will be medical agents having less side-effects.

[0007] On the other hand, a lot of PG compounds wherein phenyl group is introduced in the  $\omega$ -chain are known, e. g. the following patent applications. The comments in the parenthesis show the use of the compounds.

50

9-oxo type: JP kokai sho 49-92053 (i.e. US patent No. 4,036,832) (hypotensive effect etc.),

9-chloro substituted type: JP kokai sho 56-92860 (i.e. US patent 4,444,788) (luteal recessive effect etc.),

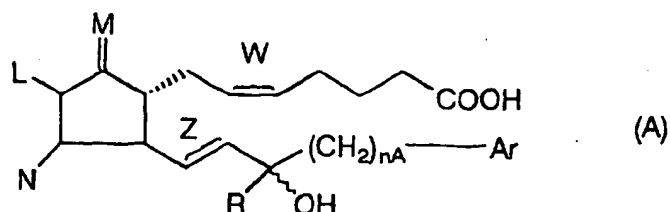

9-fluoro substituted type: JP kokai sho 58-8059 (i.e. US patent 4,454,339) (luteal recessive effect etc.),

55

11-deoxy type: JP kokai sho 53-135956 (i.e. US patent 3,932,389) (intermediates for prostaglandin having hypotensive effect etc.).

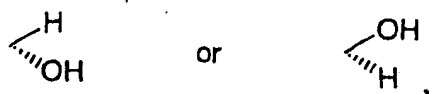

JP kokai sho 49-92053 (i.e. US patent No. 3,232,389) discloses that the following compounds have hypotensive effect, stimulating effect against smooth muscle, peptic ulcers, bronchodilator effect and therefore they are useful.

[0008] A compound of formula (A)

(wherein Ar is  $\alpha$ - or  $\beta$ - furyl,  $\alpha$ - or  $\beta$ - thienyl,  $\alpha$ - or  $\beta$ - naphthyl, phenyl, 3,4-dimethoxyphenyl, 3,4-methylenedioxyphenyl, 3,4,5-trimethoxyphenyl or phenyl monosubstituted by halo, trifluoromethyl, phenyl, lower alkyl or lower alkoxy,

nA is 0 or an integer of 1 ~ 5, with the proviso that when Ar is phenyl, substituted phenyl or naphthyl, then nA is 0 or 1,  
 R is hydrogen atom or lower alkyl,  
 W is a bond or a cis double bond,  
 Z is a bond or a trans double bond,  
 M is keto,

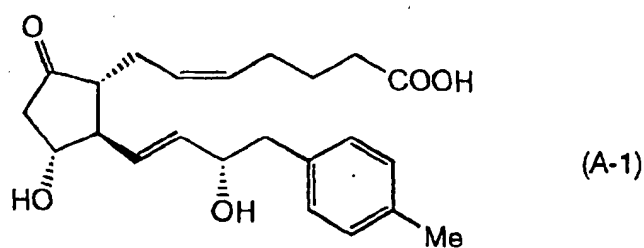

N and L are taken together to form a bond or when L is hydrogen, N is selected so as to complete A, E or F prostaglandin structure), or  
 lower alkanoyl, formyl or benzoyl ester of free hydroxy group in C9, C11 or C15 position and a pharmaceutically acceptable salt thereof.

[0009] The specification provides specific PGE<sub>2</sub> compounds in which phenyl substituted by alkyl or alkoxy is introduced in the  $\omega$ -chain; i.e. the compounds of examples 55 and 72 of the following formula.

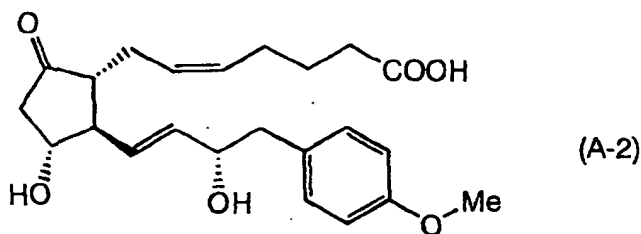

Example 55:

[0010]

Example 72:

[0011]

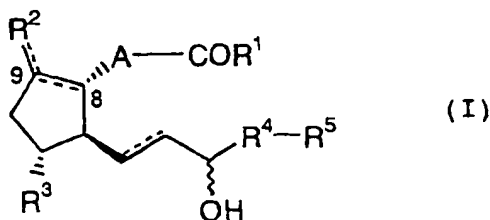

Disclosure of the present invention

[0012] The present invention consists in, as described hereafter, the fact that the present inventors have found that PGE compounds in which the  $\omega$ -chain includes phenyl group substituted by particular substituents bind strongly on EP<sub>4</sub> and bind weakly on the other PG receptors including other subtypes than EP<sub>4</sub>. In other words, the present inventors have found that adoption of particular groups maintained EP<sub>4</sub> activity and the selectivity for EP<sub>4</sub> over other receptors is improved, to complete the invention.

[0013] The present invention relates to

(1) an  $\omega$ -substituted phenyl prostaglandin E derivative of formula (I)

(wherein A is C2-8 alkylene, C2-8 alkenylene, C1-4 alkylene-phenylene, or C2-4 alkenylene-phenylene, R<sup>1</sup> is hydroxy, C1-6 alkyloxy, C1-6 alkyloxy-C1-6 alkyloxy, HO-C1-6 alkyloxy or a formula of NR<sup>6</sup>R<sup>7</sup> (wherein R<sup>6</sup> and R<sup>7</sup> are each independently hydrogen atom or C1-4 alkyl), R<sup>2</sup> is oxo, halogen or a group of formula R<sup>8</sup>-COO- (wherein R<sup>8</sup> is hydrogen, C1-4 alkyl, phenyl or phenyl(C1-4 alkyl), C1-4 alkyloxy, HOOC-C1-4 alkyl, C1-4 alkyloxy-carbonyl-C1-4 alkyl, HOOC-C2-4 alkenyl or C1-4 alkyloxy-carbonyl-C2-4 alkenyl), R<sup>3</sup> is hydrogen atom or hydroxy, R<sup>4</sup> is C1-4 alkylene, R<sup>5</sup> is phenyl substituted by the following groups:

## Pharmacological Activities

[0048] The compounds of the present invention of formula (I) bind strongly and act on EP<sub>4</sub> receptor which is PGE<sub>2</sub> receptor subtype.

[0049] For example, in the laboratory the effects of the compounds of the present invention were confirmed by binding assay using expression cell of prostanoids receptor subtype.

## (i) Binding assay using expression cell of prostanoids receptor subtype

[0050] The preparation of membrane fraction was carried out according to the method of Sugimoto et al. [J. Biol. Chem., 267, 6463-6466 (1992)], using expression CHO cell of the prostanoids receptor subtype (mouse EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub> and human IP).

[0051] The standard assay mixture containing membrane fraction (0.5 mg/ml) and [<sup>3</sup>H]-PGE<sub>2</sub> in a final volume of 200 µl was incubated for 1 hour at room temperature. The reaction was terminated by addition of ice-cooled buffer (3 ml). The mixture was filtered through a GF/B glass filter under reduced pressure. The radioactivity associated with the filter was measured by liquid scintillation counting.

[0052] K<sub>d</sub> and B<sub>max</sub> values were determined from Scatchard plots [Ann. N. Y. Acad. Sci., 51, 660 (1949)]. Non-specific binding was calculated as the binding in the presence of an excess (2.5 µM) of unlabeled PGE<sub>2</sub>. In the measurement of [<sup>3</sup>H]-PGE<sub>2</sub> binding inhibitory activity, [<sup>3</sup>H]-PGE<sub>2</sub> (2.5 nM) and various concentrations of the compounds of the present invention were added. The following buffer was used in all reactions.

[0053] Buffer ; 10 mM potassium phosphate (pH 6.0), 1mM EDTA, 10 mM MgCl<sub>2</sub>, 0.1 M NaCl.

[0054] The dissociation constant K<sub>i</sub> (µM) of each compound was calculated by the following equation.

$$K_i = IC_{50} / (1 + ([C]/K_d));$$

[0055] The results are shown in the Tables 19 and 20.

[0056] As shown above, it is clear that the compounds of the present invention bind strongly on subtype EP<sub>4</sub> and weakly on the other PGE<sub>2</sub> receptors (e.g. EP<sub>3</sub>).

#### Toxicity

[0057] The toxicity of the compounds of the present invention is very low and therefore, it is confirmed that these compounds are safe for pharmaceutical use.

#### Industrial Applicability

#### Application to Pharmaceuticals

[0058] The compounds of the present invention of formula (I) bind selectively and act on PGE<sub>2</sub> receptor, especially on EP<sub>4</sub> subtype receptor and therefore are useful for the prophylaxis and/or treatment of immune diseases (autoimmune diseases (amyotrophic lateral sclerosis (ALS), multiple sclerosis, Sjogren's syndrome, arthritis, rheumatoid arthritis, systemic lupus erythematosus, etc.), post-transplantation graft rejection, etc.), asthma, abnormal bone formation, neurocyte death, pulmopathy, hepatopathy, acute hepatitis, nephritis, renal insufficiency, hypertension, myocardial ischemia, systemic inflammatory syndrome, pain induced by ambustion, sepsis, hemophagocytosis syndrome, macrophage activation syndrome, Still's diseases, Kawasaki diseases, burn, systemic granuloma, ulcerative colitis, Crohn's diseases, hypercytokinemia at dialysis, multiple organ failure, shock, etc. They are also connected with sleeping disorders and platelet coagulations, and therefore they are thought to be useful for these diseases.

[0059] Among the compounds of the present invention of formula (I), the compounds which bind on other subtypes than EP<sub>4</sub> weakly do not express other effect, and therefore it is probable that they will be those agents having less adverse effects.

[0060] For the purpose described hereinbefore, the compounds of the present invention of formula (I), non-toxic salts thereof and CD clathrates thereof may normally be administered systemically or topically, by oral or parenteral administration.

[0061] The doses to be administered are determined depending upon age, body weight, symptom, the desired therapeutic effect, the route of administration, and the duration of the treatment etc. In the human adult, the doses per

person per dose are generally from 1 µg to 100 mg, by oral administration, from once up to several times per day, and from 0.1 µg to 10 mg, by parenteral administration (preferably intravenously) from once up to several times per day, or by continuous administration for from 1 hour to 24 hours per day into vein.

[0062] As mentioned hereinbefore, the doses to be administered depend upon various conditions. Therefore, there are cases in which doses lower than or greater than the ranges specified hereinbefore may be used.

[0063] The compounds of the present invention may be administered in the form, for example, of solid compositions, liquid compositions or other compositions for oral administration, or injections, liniments or suppositories etc. for parenteral administration.

[0064] Solid compositions for oral administration include compressed tablets, pills, capsules, dispersible powders, and granules etc.

[0065] Capsules include hard capsules and soft capsules.

[0066] In these solid compositions, one or more of the active compound(s) are admixed with at least one inert diluent, e.g. lactose, mannitol, mannit, glucose, hydroxypropyl cellulose, microcrystalline cellulose, starch, polyvinyl pyrrolidone, magnesium metasilicate aluminate. The composition may comprise, according to the conventional manner, additives other than inert diluents, e.g. lubricating agents such as magnesium stearate, disintegrating agents such as cellulose calcium glycolate, agents to assist dissolution such as glutamic acid, aspartic acid. The tablets or pills may, if desired, be coated with film of gastric or enteric material such as sugar, gelatin, hydroxypropyl cellulose, hydroxypropyl cellulose phthalate etc. or be coated with more than one film. Coating may include containment within capsules of absorbable materials such as gelatin.

[0067] Liquid compositions for oral administration include pharmaceutically acceptable emulsions, solutions, syrups and elixirs etc. In such liquid compositions, one or more of the active compound(s) may be contained in inert diluent (s) commonly used in the art (e.g. purified water, ethanol). Besides inert diluents, such compositions may also comprise assisting agents (e.g. wetting agents, suspending agents), sweetening agents, flavoring agents, perfuming agents and preserving agents.

[0068] Other compositions for oral administration include spray compositions which comprise one or more of the active compound(s), prepared by methods known *per se*. Spray compositions may comprise stabilizing agents such as sodium sulfite hydride, isotonic buffers such as sodium chloride, sodium citrate or citric acid. For the preparation of such spray compositions, for example, the method described in the United States Patent No. 2,868,691 or No. 3,095,355 may be used.

[0069] Injections for parenteral administration include sterile aqueous or non-aqueous solutions, suspensions and emulsions. Aqueous solutions and suspensions include, for example, distilled water for injection and physiological salt solution. Non-aqueous solution and suspensions include, for example, propylene glycol, polyethylene glycol, vegetable oil such as olive oil, alcohol such as ethanol, POLYSORBATE80 (registered trademark) etc. These compositions may comprise assisting agents such as preserving agents, wetting agents, emulsifying agents, dispersing agents, stabilizing agents, agents assisting dissolution (e.g. glutamic acid, aspartic acid etc.). They may be sterilized for example, by filtration through a bacteria-retaining filter, by incorporation of sterilizing agents in the compositions or by irradiation. They may also be manufactured in the form of sterile solid compositions which may be dissolved in sterile water or some other sterile solvent(s) for injection before use.

[0070] Other compositions for parenteral administration include liquids for external use, and ointment, endermic liniments, suppositories for rectal administration and pessaries for vaginal administration etc. which comprise one or more of active compound(s) and may be prepared by conventional methods.

[0177]

[0178] Under atmosphere of argon to a solution of (3S)-1-iodo-4-(3-methoxymethylphenyl)-3-t-butyldimethylsilyloxy-1E-butene (186 mg) in anhydrous diethyl ether (2.0 ml) was added t-butyl lithium (1.64 M solution in pentane, 0.52 ml) dropwise at -78 °C and the mixture was stirred for 45 minutes at the same condition. Thereto was added lithium 2-thienylcyano cuprate (0.25 M solution in tetrahydrofuran, 2.1 ml) dropwise and the obtained yellow sepia solution was stirred for 15 minutes. Thereto was added a solution of 2-[6-(2-t-butyldimethylsilyloxyethoxy)carbonylhexyl]-4- $\alpha$ -t-butyldimethylsilyloxy-2-cyclopenten-1-one (155 mg) in anhydrous diethyl ether (2.0 ml) dropwise slowly and the obtained dark yellow solution was allowed to warm over a period of 40 minutes to -20 °C. Thereto was added lactic anhydride (0.16 ml) and the mixture was stirred for 30 minutes at the same condition. The reaction was terminated by adding a mixture of a saturated aqueous solution of ammonium chloride and a 28% aqueous solution of ammonia (9 : 1), and the mixture was allowed to warm to room temperature. The reaction mixture was extracted with ethyl acetate and the organic layer was washed with a mixture of a saturated aqueous solution of ammonium chloride and a 28% ammonia water (9 : 1), and then with a saturated aqueous solution of sodium chloride, dried over anhydrous sodium sulfate and the solvent was evaporated. The residue was purified by column chromatography on silica gel (hexane : ethyl acetate = 20 : 1) to give the title compound (185 mg) having the following physical data.

10 [0179]

25 [0180] To a solution of the compound synthesized in reference example 22 (180 mg) in acetonitrile (2 ml) was added pyridine (0.2 ml) and hydrofluoric acid-pyridine complex (0.4 ml) at 0 °C and the mixture was stirred for 2 hours at room temperature.
